4-HYDROXYQUINOLINE-3-CARBOXAMIDES AND HYDRAZIDES AS ANTIVIRAL AGENTS

FIELD OF THE INVENTION

5 The present invention provides 4-hydroxyquinoline-3-carboxamide derivatives, more specifically, provides N-[(4-chlorophenyl)methyl]-4-hydroxy-3-quinolinecarboxamide of formula I. These compounds are useful as antiviral agents, in particular, as agents against viruses of the herpes family.

10 BACKGROUND OF THE INVENTION

 The herpesviruses comprise a large family of double stranded DNA viruses. They are the source of the most common viral illnesses in man. Eight of the herpesviruses, herpes simplex virus types 1 and 2 (HSV-1 and HSV-2), varicella zoster virus (VZV), human cytomegalovirus (HCMV), Epstein-Barr virus (EBV), and
15 human herpes viruses 6, 7, and 8 (HHV-6, HHV-7, and HHV-8), have been shown to infect humans.

 HSV-1 and HSV-2 cause herpetic lesions on the lips and genitals, respectively. They also occasionally cause infections of the eye and encephalitis. HCMV causes birth defects in infants and a variety of diseases in
20 immunocompromised patients such as retinitis, pneumonia, and gastrointestinal disease. VZV is the causative agent of chicken pox and shingles. EBV causes infectious mononucleosis. It can also cause lymphomas in immunocompromised patients and has been associated with Burkitt's lymphoma, nasopharyngeal carcinoma, and Hodgkins disease. HHV-6 is the causative agent of roseola and may
25 be associated with multiple sclerosis and chronic fatigue syndrome. HHV-7 disease association is unclear, but it may be involved in some cases of roseola. HHV-8 has been associated with Kaposi's sarcoma, body cavity based lymphomas, and multiple myeloma.

 Compounds of the present invention are distinct from all other
30 hydroxyquinoline pharmaceutical agents in that the unique position of chloro substituent on the N-phenylmethyl of formula I is critical for having useful antiviral activities. These compounds are useful to treat or prevent the above referenced herpesviral infections, particularly, human cytomegaloviral infection.

35 INFORMATION DISCLOSURE

 U.S. Patent 4,959,363 discloses quinolones of structure 3 useful as anti-

herpes virus agents:

3

wherein R is hydrogen, hydroxy, amino or lower alkyl; R¹ is lower alkyl, lower alkenyl, cycloalkyl, pyridinyl, phenyl, or substituted phenyl; R² is hydrogen, amino, or hydroxy; R⁶ is H or F; and R⁷ is phenyl, pyridyl, or selected other heterocycles. It does not disclose compounds wherein R is alkylaryl (substituted) and R¹ is hydrogen.

Related compounds in which the NHR group of structure 3 is replaced by groups, such as N(CH₃)₂, NHOCH₃, or N(CH₃)OH, are described in the Journal of Medicinal Chemistry 36, 1580 - 1596 (1993); and Book of Abstracts, 211th National ACS meeting, New Orleans, LA (1996).

German patent application 1,908,548 discloses antiviral agents of structure 4:

4

wherein R¹ is H, -OH, halogen, -SH, or lower alkyl sulfides; R² is H, -COOH, -CN, -CHO, lower alkyl carboxylic, -CONHR⁴, or -CON(R⁴)₂; R³ is a wide variety of substituent groups; and R⁴ is lower alkyl, aryl, arylalkyl, or lower alkylamine. However, this application does not disclose the preparation or testing of any specific carboxamide-quinoline compounds.

U. S. Patent 5,175,151 discloses compounds of structures 5 and 6 having antiviral and antihypotensive properties. A large number of quinoline compounds are disclosed generically, including structures 5 and 6. The preferred compounds of this patent are disclosed as being carboxylic esters:

5

6

Among the groups disclosed for these compounds are the following: R¹ is alkyl, alkenyl, acyl and other groups; R² is alkyl, alkoxy, aryloxy, araalkyloxy, halogen and

a wide variety of polar and/or acidic functional groups; R³ is H, alkyl, aryl, alkaryl, alkenyl, heteroalkyl, and other groups; R⁴ and R⁵ are H, alkyl, aryl, alkaryl, alkenyl, heteroalkyl, heteroaryl, and other groups, and are the same or different. All of these compounds have an oxygen substituent or an imidazolyl group in the 2-position of the quinoline ring.

Japanese patent JP 08151368 discloses compounds of structure 7 having activity against herpes viruses:

wherein R¹ is alkenyl, cycloalkyl, aryl or heterocycle; R² is optionally substituted aryl or heterocycle; and X is H or halogen; and A is N or CH.

Japanese patent 02264724 discloses antiviral agents having structure 8:

wherein R¹ is alkyl, alkenyl, cycloalkyl, aryl or heterocycle; R² is H, halogen, alkoxy, OH, protected OH, or mono or dialkylamino; R³ is optionally substituted cycloalkyl or vinyl; A is N or C(R₄); and R⁴ is H or halo.

Japanese patent 02152966 discloses compounds of structure 9 useful as anti-asthma and anti-allergy agents:

wherein R¹ is H, lower alkyl, phenyl, or phenyl-lower alkyl; R² is hydrogen or lower alkyl; and R³ is alkyl (optionally substituted by lower alkoxy or heterocyclic group), phenyl lower alkyl (optionally substituted by lower alkyl, halogen, lower alkoxy or sulphydryl on the phenyl ring) or naphthyl-lower alkyl. The combination of R² and R³ into a heterocycle encompassing the amide nitrogen is also disclosed.

Phenethyl compounds, such as structures 10-14, have been described as synthetic intermediates in the synthesis of antimalarial compounds (Indian J. of

Chemistry, 1010 (1969); Indian J. of Chemistry, *vol.* 24B, 737 (1985)).

US Patent 4,450,167 discloses compounds of structure 15 useful as anxiolytics.

15

R¹ = H, alkyl, phenyl, PhCH₂
 R⁴ = alkyl, aryl, heteroaryl
 R³ = H, OH
 R = 6- or 7-H, halogen, alkyl, cycloalkyl, etc.

These compounds are derivatives of arylamines or alkylamines, unlike the compounds of the present invention which are derivatives of benzylamine (an arylalkylamine).

US Patent 4,786,644 discloses quinoline carboxamides of structure 16 useful as analgesics:

R¹, R² = halogen, lower alkyl, lower alkoxy, same or different
 R³ = phenyl or heteroaryl, optionally substituted.
 m, n = 0 or 1

US Patent 4,397,856 discloses structural variations of 4-hydroxyquinolines, such as structure 17, which have analgesic activity.

X = H, halogen, lower alkyl, lower alkoxy, OCF₃, SCF₃, or CF₃

R¹ = H, lower alkyl

R² = H or a ring which is optionally unsaturated, optionally heterocyclic, optionally substituted.

R³ = H, lower alkyl, halogen

R⁴ = H or halogen

R⁵ = halogen

DE 3808118 discloses synthetic intermediates of general structure 18.

R = lower alkyl, phenyl, or substituted phenyl

R⁵, R⁶ = H, NO₂, or halogen, same or different

R⁷ = H, lower alkyl, halogen, amino, or subst. amino

R⁸ = H, lower alkyl, alkoxy (1-3 carbons), alkylmercapto (1-3 carbons), halogen, nitro, alkoxycarbonyl, or cyano.

These compounds are derivatives of arylamines or alkylamines, unlike the

15 compounds of the present invention, which are derivatives of benzylamine (an arylalkylamine).

The use of quinolines, such as general structure 19, as synthetic intermediates in the synthesis of antibiotics, such as general structure 20, are described in several sources, for example, in US Patent 3,864,329; US 3,951,955; EP 20 736531 (which discloses alpha-substituted pyridazino quinoline compounds); and DD 279887. In some of these references, the structures below, which are phenylglycine derivatives, are drawn as quinolone tautomers.

Hydroxyquinoline-beta lactam conjugates, such as structure 21, have also been described in, for example, US Patent 5,019,570 (and its equivalent EP 304158) 35 and US Patent 5,491,139.

US Patent 3,496,184 (and its equivalents, GB 1270412 and DE 1929165)

discloses carboxylic esters of general structure 22 as livestock growth-promoters. The corresponding carboxylic acids, amides, nitriles, and hydrazides are generically claimed. The amides and hydrazides are described as optionally substituted on nitrogen with one or more alkyl or aralkyl groups. One amide, 23, and one hydrazide, 24, are described in the examples.

At least one of R¹, R², R³, or R⁴ is (cycloalkyl-A-X-) where X = S or O and A = -(CH₂)_n- or a single bond between the alkyl or cycloalkyl group and A.

23 R = H

24 R = NH₂

US Patent 3,960,868 discloses acid, esters, and amides of structure 25 having antiinflammatory, analgesic, antimicrobial, and histamine liberation inhibiting activities.

R_x = OH, lower alkoxy, -NH₂, lower alkylamino, lower dialkylamino cyclic amines, phenylamines (anilines) and arylalkylamines such as benzyl, optionally substituted.

R₀ = H, alkyl, OH, or lower alkoxy.

R₁ = alkyl or cycloalkyl, optionally substituted.

R₂ = cycloalkyl, cycloalkenyl or 1-adamantyl.

R₃ = alkyl, halogen or hydrogen.

US Patent 5,563,141 discloses compounds of structure 26 containing an acidic and a basic functional group separated by an appropriate linker as antagonists of adhesion molecules.

R = H, alkyl, or phenyl-(CH₂)_n-

X = an amino-substituted aromatic heterocycle

Y = an acidic functional group

These compounds contain an amino-substituted heterocycle attached through a suitable linker to the carboxamide nitrogen.

Published PCT application, WO 96/16046, discloses pyrimidine derivatives, including structures 27 and 28 as antibacterial agents.

The compounds described by structures 27 and 28 all contain a diaminopyrimidine group attached to the quinoline ring by a piperazine or phenyl ring spacer.

Published PCT application, WO 95/11592, discloses substituted quinolines 29 as marine anti-fouling agents. WO 96/32015 claims an equally broad group of quinolines as antifungal agents.

Published PCT application, WO 97/15557 discloses a method for preparing combinatorial libraries of substituted quinolines of structure 29. According to the broad definitions of $X^1 - X^6$, any of the quinoline ring substituents may independently be OH or $(\text{C}=\text{O})\text{NHR}^7$, where R^7 is an arylalkyl group. "Nuc" is defined as a chemical moiety having a reactive pair of electrons, including but not limited to, amines, enolates, Grignard reagents, alkoxides, and cyanide.

Several sources describe the synthesis of hydrazides their conversion to acylhydrazones 30, such as the following: J. Indian Chem. Soc., vol. 68, 138 - 141 (1991); J. Sci Ind. Res., vol. 14c, 228-230 (1955); and J. Sci Ind. Res., vol. 14b, 261-263 (1955).

Compounds of structure 30 are substituted on the outer hydrazide nitrogen via a carbon-nitrogen double bond.

The acylthiosemicarbazides 31 in chemical synthesis have been described in Indian J. Chem., vol. 16B, 231-234 (1978). Structures 32 are listed in the CAS
5 registry file, but do not appear to have corresponding literature references.

R = aryl, alkyl, cycloalkyl

31

R = CH₂Ph, *tert*-butyl

32

The compounds described by these two structures have a carbonyl (C=O) or thiocarbonyl (C=S) group attached to the outer hydrazine nitrogen atom.

U.S. Patent 5,318,96; U.S. Patent 4,777,252; and Canadian patent application
15 2,024,282 disclose compounds of structures 33 and 34.

33

34

US Patent 5,610,192 discloses compounds of structure 35 useful as metazoan
protease inhibitors wherein X is a planar linker group including amide, urea,
fumarate bisamides, and N-acyl hydrazones.

35

R = aryl or heteroaryl

Quinoline ring optionally substituted
with OH or a variety of other groups in
either or both rings.

The compounds of structure 35 have a substituent attached to the outer hydrazine

nitrogen by a carbon-nitrogen double bond.

Japanese patent application JP8301849-A discloses a heterocyclic compound of structure 36 as tachykinin receptor antagonists:

5

wherein ring A is an optionally substituted homocyclic or heterocyclic ring; B is an optionally substituted amino group or optionally substituted hydroxyl group; ring C is an optionally substituted homocyclic or heterocyclic ring; -X-Y- is an entity in which (1) one element is -NR₁- (R₁ is H, or an optionally substituted hydrocarbon group) or -O-, and the second element is -CO- or CS-, or (2) one element is -N= and the other element is =CR₂- (R₂ is H, halogen, optionally substituted hydrocarbon group, optionally substituted amino group, or optionally substituted hydroxyl group); R is H or optionally substituted hydrocarbon group; and n is 1-3.

Published PCT application, WO 98/12180, discloses compounds of structure 37 for controlling undersirable plants:

20

wherein R₁, R₂ are hydrogen, nitro, halogen, nitrile, SCN, hydroxyl, thiol, optionally substituted alkyl(1-6), alkoxy (1-6), alkylthio (C1-6), alkylsulfinyl (C1-6), alkylsulfonyl (C1-6), alkoxysulfonyl (C1-6), or optionally substituted phenyl, phenylthio, phenoxy, phenylsulfinyl or phenylsulfonyl; Z is an optionally substituted, 4-membered, unsaturated, partially or completely saturated chain with three carbon atoms and one nitrogen atom; Q is an optionally substituted cyclohexane-1,3-dione linked at position 2.

WO 97/48694 discloses compounds of structure 38 useful for treating bone growth:

35

wherein R^{1-4} are a variety of substituents including alkyl optionally substituted by halogen and alkenyl. R^5 is an optionally substituted carbocyclic or heterocyclic ring.

DE 19642290 discloses compounds of structure 39 useful for treating Alzheimer's disease:

5

10 wherein R^1 is hydrogen, halogen, alkyl(1-4), or alkoxy(1-4). R^2 is hydrogen, halogen, alkyl(1-4) opt. substituted by fluorine, alkylthio(1-4) opt. substituted by fluorine, alkoxy(1-4) opt. substituted by fluorine, $O(CH_2)_{0-3}(aryl)amino$. R^3 and R^4 are hydrogen, alkyl(1-4), $(CH_2)_0N(alkyl)_{1,2}$, alkylamino linked amides, $-C_5H_N(CH_2)_{0-9}Ph(OS)$.

15 US patent 4870182 discloses compounds of structure 40 useful as antiallergics:

20

wherein Y is $CONR'R''$, R' and R'' are hydrogen or alkyl(1-4), R'' may also be phenyl; X^2 may be nitro, amino, cyano, alkyl(1-3), alkoxy(1-3), alkylmercapto(1-3), alkylsulfonyl(1-3), or phenylsulfonyl; X^3 , X^4 and X^5 are hydrogen, halogen, nitro, cyano, alkyl(1-3), alkoxy(1-3), alkylmercapto(1-3), alkylsulfonyl(1-3), or a phenylsulfonyl group which is optionally substituted in the aryl radical.

25 US patent 4965266 discloses compounds of structure 41 useful as antiallergics:

30

35 wherein A is an alkylene group; X is $NCHPh_2$ or $C=CPh_2$; R^1 is hydrogen, halogen, hydroxy, alkyl(1-6), alkoxy(1-6), nitro, or cyano.

Published PCT application, WO 97/04779 discloses compounds of structure 42 useful as inhibitors of Phosphodiesterase IV esterase and/or Tumour Necrosis Factor activity.

5

- 10 In structure 42, wherein R¹ is optionally substituted alkyl(1-6), alkylcycloalkyl(1-6), alkylaryl (1-6), alkylheterocyclo(1-6), or alkylheteroaryl (1-6), unlike the compounds of the present invention wherein R¹ is hydrogen.

SUMMARY OF THE INVENTION

15

-C(=O)R⁵, -SR⁵, aryl, -OR⁵, -NR⁷R⁸, -OP(=O)(R⁹)₂, -OPH(=O)R⁹
-OC(=O)R¹⁰, -O-glycyl, -O-valyl, -O-lysyl or -O-seluptamatyl, or
 - 10 c) -(CH₂)_m-het;
- R¹² is
- a) H,
 - b) -CN,
 - c) C₁₋₈ alkyl,
 - 15 d) C₁₋₈ alkyl substituted with one to three -CN, halo, -NO₂, -C(=O)R⁵,
-COOR⁵, aryl, het, -SR⁵, -OR⁵, -NR⁷R⁸, -OP(=O)(R⁹)₂ or -OPH(=O)R⁹,
 - e) -C(=O)R⁵, or
 - f) -COOR⁵;
- R¹³ is
- 20 a) C₁₋₈ alkyl,
 - b) C₁₋₈ alkyl substituted one to three -CN, halo, -NO₂, -C(=O)R⁵, het,
aryl, -COOR⁵, -SR⁵, -OR⁵ or -NR⁷R⁸,
 - c) het,
 - d) aryl,
 - 25 e) -NR⁷R⁸,
 - f) OR⁵, or
 - h) halo;
- R¹⁴ is
- a) C₁₋₈ alkyl, or
 - 30 b) C₁₋₈ alkyl substituted with one to three -CN, halo, -NO₂, -C(=O)R⁵,
-COOR⁵, het, aryl, -OR⁵, or -NR⁷R⁸;
- R¹⁵ is
- a) -NH₂, or
 - b) -NHNH₂;
- 35 R¹⁶ and R¹⁷ is independently
- a) H,

- b) C₁₋₄ alkyl,
- b) -C(=O)C₁₋₄ alkyl, or
- c) -C(=O)-(CH)_m-aryl;

aryl is phenyl or naphthyl, optionally substituted with R¹⁸;

- 5 het is a 5-, 6- or 7-membered saturated or unsaturated heterocyclic ring having 1-3 heteroatoms selected from the group consisting of nitrogen, oxygen and sulfur, wherein the heterocyclic ring is optionally fused to a benzene ring, wherein aryl, het and benzene ring are optionally substituted with R¹⁸;

R¹⁸ is

- 10 a) halo,
- b) -NO₂,
- c) phenyl, optionally substituted with one to five -OH, -CN, halo, -NO₂, C₁₋₆ alkyl, het, or OC₁₋₄ alkyl,
- d) C₁₋₈ alkyl, optionally substituted with one to three halo, -CN, -NO₂,
- 15 aryl, -SR⁵, -OR⁵ or -NR⁷R⁸,
- e) OR⁵, or
- f) -SO₂NH₂;

M is sodium, potassium or lithium atom;

i is 1 or 2;

- 20 m is 0, 1, 2, or 4;

n is 1, 2, 3 or 4;

and with the following provisos:

- (a) where R², R³ and R⁴ are each hydrogen, then R¹ is other than methoxy,
- (b) where R⁴ is Cl, and R² and R³ are each hydrogen, then R¹ is other than methyl,
- 25 (c) where R¹ is hydrogen, R² and R⁴ are each fluoro, R³ is het, then het is other than substituted piperazinyl,
- (d) where R¹ and R³ are each hydrogen, R² is fluoro, then R⁴ is other than fluoro,
- (e) where R² and R⁴ are each hydrogen, R¹ is fluoro, then R³ is other than fluoro,
- (f) where R¹ and R³ are each hydrogen, R² is chloro, then R⁴ is other than chloro,
- 30 (g) where R¹, R² and R³ are each hydrogen, then R⁴ is not bromo,
- (h) where R¹, R³ and R⁴ are each hydrogen, then R² is not trifluoromethoxy,
- (i) where R¹, R² and R⁴ are each hydrogen, then R³ is not trifluoromethoxy, and
- (j) where R¹, R² and R³ are each hydrogen, then R⁴ is not morpholinyl.

In another aspect, the present invention also provides:

- 35 an antiviral pharmaceutical composition which comprises a pharmaceutically acceptable excipient and an effective amount of a compound of formula I,

a method of treating and preventing herpesviral infections in a mammal, including human, and

a use of a compound of formula I to prepare a medicament for treating and preventing herpesviral infections in a mammal, including human.

DETAILED DESCRIPTION OF THE INVENTION

For the purpose of the present invention, the carbon atom content of various hydrocarbon-containing moieties is indicated by a prefix designating the minimum and maximum number of carbon atoms in the moiety, i.e., the prefix C_{i,j} indicates a moiety of the integer "i" to the integer "j" carbon atoms, inclusive. Thus, for
10 example, (C_{1,3})alkyl refers to alkyl of one to three carbon atoms, inclusive, or methyl, ethyl, propyl and isopropyl, straight and branched forms thereof.

The compounds of the present invention are named according to the IUPAC or CAS nomenclature system.

15 The term "C₁₋₈", "C₁₋₆" and "C₁₋₄" alkyl refer to an alkyl group having one to eight, one to six and one to four carbon atoms respectively such as, for example, methyl, ethyl, propyl, butyl, pentyl, hexyl, heptyl, octyl and their isomeric forms thereof.

The term "C₁₋₆ alkynyl" refers to at least one triple bond alkynyl group having
20 two to six carbon atoms.

The term "C₁₋₆ alkenyl refers to at least one double bond alkenyl group having two to six carbon atoms.

The term "C₃₋₆ cycloalkyl" refers to a saturated or unsaturated ring having three to six atoms such as, for example, cyclopropyl, cyclobutyl, cyclopentyl,
25 cyclohexyl and their isomeric forms thereof.

The term "C₁₋₄ alkoxy" refers to an alkyl group having one to four carbon atoms attached to an oxygen atom of a hydroxyl group such as, for example, methoxy, ethoxy, propyloxy, butyloxy and their isomeric forms thereof.

The term "aryl" refers to phenyl or naphthyl, which is optionally substituted
30 with one to five appropriate substituents.

The term "het" refers to a 5- or 6-membered saturated or unsaturated heterocyclic ring having 1-3 heteroatoms selected from the group consisting of nitrogen, oxygen and sulfur. The nitrogen atom may be in the protected form. The "het" is optionally substituted with one to three appropriate substituents.
35 Examples of "het" are thiadiazolyl, thiazolyl, benzothiazolyl, pyridinyl, morpholinyl, imidazolyl, indolyl, pyrrolyl, morpholinyl, thiophenyl and 2-oxo-oxazolyl.

The term "halo" refers to fluoro, chloro, bromo or iodo.

Throughout this application, abbreviations which are well known to one of ordinary skill in the art may be used such as, for example, "Ph" for phenyl, "Me" for methyl, "Et" for ethyl, "h" for hour or hours and "rt" for room temperature.

5 Compounds of the present invention may be in a form of pharmaceutically acceptable salts.

"Pharmaceutically acceptable salts" refers to those salts which possess the biological effectiveness and properties of the parent compound and which are not biologically or otherwise undesirable.

10 "N-oxide" refers to the oxidized form of the nitrogen in the ring of the 4-hydroxy-quinoline compounds of the present invention. The preparation of such compounds is well known to one of ordinary skill in organic chemistry, including methods such as oxidation with metachloro-peroxy-benzoic acid.

15 "Electron-withdrawing group" means any substituent on the ring which tends to draw electron density from the ring. Examples of such groups include halogen, nitro, cyano, carboxylic acids, carboxylic esters, sulfoxides, sulfones, sulfonamides, ketones and aldehydes.

20 The compounds of the present invention may be alternatively designated by the tautomeric structure of formula II in which the variables are the same as defined in formula I.

25 The following Charts A-V describe the preparation of the compounds of the present invention. All of the starting materials are prepared by procedures described in these charts or by procedures analogous thereto, which would be well known to one of ordinary skill in organic chemistry. All of the final compounds of the present invention are prepared by procedures described in these charts or by procedures analogous thereto, which would be well known to one of ordinary skill in organic chemistry. All of the variables used in the charts are as defined below or as in the claims.

35 In CHART A, the compounds of this invention can be prepared by one of several methods starting from appropriate 4-hydroxyquinoline-3-carboxylic esters

a-1. In the first method A-1 the ester a-1 is suspended in 5 - 10 parts of an amine and the mixture is heated to 190 - 200 °C for a period of 30 min to 4 hours. The product a-2 is isolated by diluting the cooled reaction mixture with hexanes or toluene and collecting the solid precipitate by filtration. In some cases it is

5 necessary to further purify this initial product by chromatography or by recrystallization from a suitable solvent mixture, typically acetic acid/water.

In a second method A-2, the ester a-1 is treated with two or more equivalents of the dimethylaluminum salt of an appropriate amine to produce the desired amide. The product a-2 is separated from aluminum salts which are present in the reaction
10 mixture by treatment with hydrochloric acid, and it is further purified by recrystallization or chromatography. This latter method has the advantage that less heating of the reactants is required than in the first method, and it is consequently successful in some cases in which the first method is not applicable.

In the third method A-3, the ester a-1 is hydrolyzed to the corresponding
15 carboxylic acid a-3 by the action of sodium or lithium hydroxide followed by neutralization. Carboxylic acid a-3 is then converted to the imidazolid a-4 by the action of 1,1'-carbonyldiimidazole. The imidazolid, which may be either isolated or used *in situ*, is converted to the desired amide a-2 by treatment with the requisite amine. The product is typically isolated from the reaction mixture by evaporation of
20 the solvent followed by chromatography or recrystallization, or by precipitation of the product from the reaction mixture by dilution with several volumes of water.

In the fourth method A-4, the carboxylic acid a-3 is converted to the acid chloride a-5 by the action of thionyl chloride, and it is then converted to the desired amide a-2 in a manner similar to that described for the imidazolid a-4. The
25 starting materials a-1 used in this chart are prepared by a well-known procedure, the reaction of an appropriately substituted aniline with diethyl ethoxymethylene malonate followed by pyrolysis of the resulting adduct (J. Amer. Chem. Soc., 68, 1264 (1946) and other references cited below).

Compounds of the present invention may also be prepared by following the
30 procedures described in Chart B. This procedure is further detailed the Examples 38-47.

Compounds of the present invention may also be prepared by following the procedures described in Chart C. This procedure is further detailed the Examples
48-49.

35 Compounds of the present invention may also be prepared by following the procedures described in Chart D. This procedure is further detailed the Examples

54-55.

Compounds of the present invention may also be prepared by following the procedures described in Chart E. Condensation of the aniline of structure e-1 with diethylethoxyethylene malonate (neat, 140 °C, 1.5 hours) gives an enamine
5 intermediate. Addition of diphenyl ether to the reaction mixture containing this intermediate followed by heating to 250 °C for a 2 h affords the quinoline intermediate e-2. This ester is converted to the desired amide of formula e-3 by heating neat in p-chlorobenzyl amine at 190 °C for 1.5 hours.

Compounds of the present invention may also be prepared by following the
10 procedures described in Chart F. Commercially available 2-fluoroaniline (f-1) is converted to the ethyl 8-fluoro-4-hydroxy-3-quinolinecarboxylate (f-2) by treatment with diethyl ethoxymethylenemalonate and heating at 135°C for 1 hour, followed by dilution with diphenyl ether and heating at 260°C for an additional 3 hour. The resulting ester is saponified with aqueous lithium hydroxide to afford acid f-3, which
15 is then activated with 1,1'-carbonyldiimidazole to yield imidazolide f-4. Reaction with various amines affords the desired amides of formula f-5. The amides are prepared either as discrete analogues or as part of a parallel synthesis effort.

Compounds of the present invention may also be prepared by following the procedures described in Chart G. In CHART G, a solution of the compound g-1 and
20 a primary amine are heated to 90 °C overnight to yield the compound g-2.

Compounds of the present invention may also be prepared by following the procedures described in Chart H. In CHART H, acetylenes h-2 are coupled to the iodoquinolines h-1 via palladium catalysis. The resulting quinolinyl-acetylenes h-3 are partially reduced by hydrogen over a poisoned palladium catalyst to give the cis-
25 alkenes h-4. Alternatively, the quinolinyl-acetylenes h-3 are fully reduced by hydrogen and an active palladium catalyst to give the corresponding alkanes h-5.

Compounds of the present invention may also be prepared by following the procedures described in Chart I. In CHART I, heterocyclic substituted quinolines h-2 are prepared by a palladium catalyzed coupling of the corresponding
30 tributylstannyl-heterocycle to the iodoquinoline h-1.

Compounds of the present invention may also be prepared by following the procedures described in Chart J. In CHART J, cyano-substituted quinolines j-2 are prepared from the iodoquinolines j-1 via a palladium catalyzed coupling of potassium cyanide. The cyanoquinolines j-2 are then treated with hydrogen sulfide to generate
35 the corresponding thioamides j-3. The thioamides j-3 are versatile intermediates for the synthesis of various heterocycles. For example, treatment of the thioamide j-3

with bromoacetaldehyde diethyl acetal leads to the thiazole j-4. Alternatively, the thioamide j-3 is treated with methyl triflate, followed by hydrogen sulfide and hydrazine to yield the thiocarbonylhydrazide j-5. This also is a versatile intermediate for heterocycle synthesis. For example, treatment with acetyl chloride
5 produces the methylthiadiazole j-6.

Compounds of the present invention may also be prepared by following the procedures described in Chart K. In CHART K, thiocyanates k-1 are prepared by electrophilic aromatic substitution reactions on anilines, using ammonium thiocyanate and bromine. Conversion of the thiocyanate to a benzyl sulfide is
10 accomplished by alkaline hydrolysis followed by alkylation of the intermediate thiol with benzyl chloride, giving compounds k-2. Elaboration of the aniline to the 4-hydroxyquinoline ring system, represented by k-3, is accomplished by heating with diethyl ethoxymethylenemalonate, first at 130-150°C, then in refluxing diphenyl ether. Treatment of esters of k-3 with 4-chlorobenzylamine at elevated temperature
15 effects aminolysis, leading to compounds of Formula k-4. Oxidation of the sulfide to sulfonyl chloride is effected by treatment with chlorine in aqueous acetic acid. The resulting sulfonyl chlorides of Formula k-5 are transformed to sulfonamides k-6 by treatment with amines in pyridine solution.

Compounds of the present invention may also be prepared by following the procedures described in Chart L. In CHART L, compounds of l-1 are phosphitylated
20 with di-*tert*-butyl diethyl phosphoramidite to give an intermediate phosphite, which is oxidized *in situ* with *m*-chloroperbenzoic acid to provide di-*tert*-butyl phosphates of l-2. Treatment of the phosphates with trifluoroacetic acid cleaves the *tert*-butyl groups, providing phosphoric acids of l-3. If the *m*-chloroperbenzoic acid oxidation
25 step is omitted from the phosphitylation reaction, mono-*tert*-butyl phosphites of l-4 may be isolated. Treatment of these with trifluoroacetic acid provides phosphites of l-5.

Compounds of the present invention may also be prepared by following the procedures described in Chart M. In CHART M, alcohols of m-1 are coupled with
30 suleptanic acid triethylammonium salt (triethylammonium 2-[(7-carboxyheptanoyl)-(methyl)amino]-1-ethanesulfonate), using diisopropylcarbodiimide and 4-dimethylaminopyridine, to provide the corresponding esters. Exchange of the triethylammonium salt with sodium ion affords sodium salts m-2.

Compounds of the present invention may also be prepared by following the
35 procedures described in Chart N. In CHART N, alkylation of 3-mercaptoaniline with benzyl chloride and sodium hydride affords benzyl sulfide of n-1. Elaboration of

the aniline to the 4-hydroxyquinoline ring system of n-2 is accomplished by heating with diethyl ethoxymethylenemalonate, first at 135°C, then in refluxing diphenyl ether. Treatment of ester n-2 with 4-chlorobenzylamine at elevated temperature effects aminolysis, leading to amide n-3. Oxidation of the sulfide to sulfonyl chloride
5 is effected by treatment with chlorine in aqueous acetic acid. The resulting sulfonyl chloride of Formula n-4 is transformed to sulfonamides n-5 by treatment with amines in pyridine solution.

Compounds of the present invention may also be prepared by following the procedures described in Chart O. In CHART O, intermediate o-2 is prepared by
10 treating the phenol o-1 with chloroethanol and sodium hydroxide. Hydrogenation of o-2 in the presence of a palladium catalyst provides o-3, which upon stirring neat with diethyl ethoxymethylenemalonate provides the intermediate o-4. Selective acetylation of the hydroxyl group of o-4 with a mixture of acetic acid and acetic anhydride gives the intermediate o-5, which is cyclized in refluxing diphenyl ether to
15 give the hydroxyquinoline o-6. Treating this compound with a benzylamine derivative at 190 °C gives the desired product o-7.

Compounds of the present invention may also be prepared by following the procedures described in Chart P. In CHART P, treating 4-cyanobenzyl bromide p-1 with sodium azide in dimethylformamide gives the benzylic azide p-2. This
20 intermediate is reduced by the action of triphenylphosphine in wet tetrahydrofuran to give the desired amine p-3. The amine p-3 is used as the amine component in amide bond forming reactions such as those shown in Charts A, B, C, D, and F.

Compounds of the present invention may also be prepared by following the procedures described in Chart Q. In CHART Q, the aniline q-1 is treated with
25 diethyl ethoxymethylenemalonate at 135 °C and the resulting adduct is heated in refluxing diphenyl ether to give the quinlone q-2. Treating q-2 with dithiothreitol gives the thiol q-3, which is alkylated with an appropriate alkyl halide to give q-4. Treating q-4 with 4-chlorobenzylamine at 190 °C gives the amide q-5. Treating this amide with a single equivalent of *meta*-chloroperbenzoic acid gives the sulfoxide q-7,
30 whereas the use of two or more equivalents gives the sulfone q-6.

Compounds of the present invention may also be prepared by following the procedures described in Chart R. In CHART R, N-[(4-Chlorophenyl)methyl]-8-fluoro-4-hydroxy-6-iodo-3-quinolinecarboxamide of r-1 is converted to the 6-carboxamide r-2 by treatment with palladium (II) acetate, 1,3-bis(diphenylphosphino)propane and
35 various amines under a carbon monoxide atmosphere with heating.

Compounds of the present invention may also be prepared by following the

procedures described in Chart S. In CHART S, *N*-[(4-Chlorophenyl)methyl]-8-fluoro-4-hydroxy-6-iodo-3-quinolinecarboxamide of s-1 is converted to the 6-carboxylic acid s-2 by treatment with palladium (II) acetate, 1,3-bis(diphenylphosphino)propane and water under a carbon monoxide atmosphere with heating. The acid s-2 is treated
5 thionyl chloride to afford the acid chloride, then converted to the 6-carboxamide s-3 by treatment with *p*-chlorobenzylamine in pyridine.

Compounds of the present invention may also be prepared by following the procedures described in Chart T. In CHART T, 3-[(4-Chlorobenzyl)amino]-carbonyl)-8-fluoro-4-hydroxy-6-quinolinecarboxylic acid of example t-1 is converted to
10 the 6-*tert*-butyl carbamate t-2 by treatment with diphenylphosphoryl azide in *tert*-butanol with heating. The carbamate is removed with trifluoroacetic acid to afford the 6-aminoquinoline t-3. The amine is sulfonylated with 4-methoxyphenylsulfonyl chloride in pyridine to yield the 6-sulfonamide t-4.

Compounds of the present invention may also be prepared by following the procedures described in Chart U. In CHART U, 1-Fluoro-4-nitrobenzene u-1 is converted to 2-(4-nitroanilino)-1-ethanol u-2 (R = H) by heating with the ethanolamine in ethanol. 2-(4-nitroanilino)-1-ethanol u-2 is converted to
15 2-(4-nitroanilino)ethyl acetate u-3 by treatment with acetyl chloride. The nitro group is reduced to the free amine with palladium on carbon and hydrogen gas. The resulting aniline is treated with diethyl ethoxymethylenemalonate to give u-4. The enamine is cyclized by heating in diphenyl ether to give the quinoline u-5. Treatment with excess *p*-chlorobenzylamine affords the 3-carboxamide u-6.

Compounds of the present invention may also be prepared by following the procedures described in Chart V. In CHART V, 2-(4-nitroanilino)-1-ethanol v-1(R =
25 H) is reduced with palladium on carbon and hydrogen gas. The resulting aniline is treated with diethyl ethoxymethylenemalonate to give v-2. Treatment with 1,1'-carbonyldiimidazole cyclizes v-2 to give v-3. The enamine is then cyclized by heating in diphenyl ether to give the quinoline v-4. Treatment with excess *p*-chlorobenzylamine affords the 3-carboxamide v-5.

30 It will be apparent to those skilled in the art that the described synthetic procedures are merely representative in nature and that alternative synthetic processes are known to one of ordinary skill in organic chemistry.

The compounds of the present invention and pharmaceutically acceptable salts thereof are useful as antiviral agents. Thus, these compounds are useful to combat viral infections in animals, including man. Specifically, these compounds have anti-viral activity against the herpes virus, cytomegalovirus (CMV). These compounds are also active against other herpes viruses, such as the varicella zoster virus, the Epstein-Barr virus, the herpes simplex virus, and the human herpes virus type 8 (HHV-8).

Also, while many of the compounds of the present invention have shown activity against the CMV polymerase, these compounds may be active against the cytomegalovirus by this or other mechanisms of action. Thus, the description below of these compounds' activity against the CMV polymerase is not meant to limit the

present invention to a specific mechanism of action.

The compounds of the present invention have shown activity in one or more of the assays described below. All of these assays are indicative of a compound's activity and thus of its use as an anti-viral agent.

- 5 The HCMV polymerase assay is performed using a scintillation proximity assay (SPA) as described in several references, such as N.D. Cook, et al., Pharmaceutical Manufacturing International, pages 49-53 (1992); K. Takeuchi, Laboratory Practice, September issue (1992); US Patent No. 4,568,649 (1986); which are incorporated by reference herein. Reactions are performed in 96-well plates.
- 10 The assay is conducted in 100 μ l volume with 5.4 mM HEPES (pH 7.5), 11.7 mM KCl, 4.5 mM $MgCl_2$, 0.36 mg/ml BSA, and 90 nM 3H -dTTP. Assays are run with and without CHAPS, (3-[(3-Cholamidopropyl)-dimethylammonio]-1-propane-sulfonate) at a final concentration of 2 mM. HCMV polymerase is diluted in enzyme dilution buffer containing 50% glycerol, 250 mM NaCl, 10 mM HEPES (pH 7.5), 100
- 15 μ g/ml BSA, and 0.01% sodium azide. The HCMV polymerase, which is expressed in recombinant baculovirus-infected SF-9 cells and purified according to literature procedures, is added at 10% (or 10 μ l) of the final reaction volume, i.e., 100 μ l. Compounds are diluted in 50% DMSO and 10 μ l are added to each well. Control wells contain an equivalent concentration of DMSO. Unless noted otherwise,
- 20 reactions are initiated via the addition of 6 nM biotinylated poly(dA)-oligo(dT) template/primer to reaction mixtures containing the enzyme, substrate, and compounds of interest. Plates are incubated in a 25°C or 37°C H_2O bath and terminated via the addition of 40 μ l/reaction of 0.5 M EDTA (pH 8) per well. Reactions are terminated within the time-frame during which substrate
- 25 incorporation is linear and varied depending upon the enzyme and conditions used, i.e., 30 min. for HCMV polymerase. Ten μ l of streptavidin-SPA beads (20 mg/ml in PBS/10% glycerol) are added following termination of the reaction. Plates are incubated 10 min. at 37°C, then equilibrated to room temperature, and counted on a Packard Topcount. Linear regressions are performed and IC_{50} 's are calculated using
- 30 computer software.

- A modified version of the above HCMV polymerase assay is performed as described above, but with the following changes: Compounds are diluted in 100% DMSO until final dilution into assay buffer. In the previous assay, compounds are diluted in 50% DMSO. 4.5 mM dithiothreitol (DTT) is added to the polymerase
- 35 buffer. Also, a different lot of CMV polymerase is used, which appears to be more active resulting in a more rapid polymerase reaction. Results of the testing of

compounds of the present invention in this assay are shown in Tables 1 below. Other viral polymerase assays are performed using procedures similar to those described above.

5 These compounds of the present invention are administered in a pharmaceutical composition containing the compound in combination with a suitable excipient, the composition being useful in combating viral infections. Pharmaceutical compositions containing a compound appropriate for antiviral use are prepared by methods and contain excipients which are well known in the art. A generally recognized compendium of such methods and ingredients is Remington's Pharmaceutical Sciences by E.W. Martin (Mark Publ. Co., 15th Ed., 1975), which is hereby
10 incorporated by reference herein.

The compounds of the present invention are administered parenterally (for example, by intravenous, intraperitoneal or intramuscular injection), topically, orally, or rectally, depending on whether the preparation is used to treat internal or
15 external viral infections.

For internal infections, the compositions are administered orally or parenterally at dose levels, calculated as the free base, of about 0.1 to 300 mg/kg, preferably 1.0 to 30 mg/kg of mammal body weight, and are used in man in a unit dosage form, administered one to four times daily in the amount of 1 to 1000 mg per
20 unit dose.

For parenteral administration or for administration as drops, as for eye infections, the compounds are presented in aqueous solution in a concentration of from about 0.1 to 10%, more preferably about 0.1 to 7%. The solution may contain other ingredients, such as emulsifiers, antioxidants or buffers.

25 The exact regimen for administration of the compounds and compositions disclosed herein will necessarily be dependent upon the needs of the individual subject being treated, the type of treatment and, of course, the judgment of the attending practitioner.

EXAMPLE 1 N-[(4-Chlorophenyl)methyl]-4-hydroxy-7-(trifluoromethyl)-3-quinoline-carboxamide

5

To a solution of 0.892 g 1,1'-carbonyldiimidazole in 30 mL of tetrahydrofuran is added 1.29 g 4-hydroxy-7-trifluoromethyl-3-quinolinecarboxylic acid. The reaction is stirred at room temperature for 1 h. A solution of 0.91 mL of 4-chlorobenzylamine in 10 mL of tetrahydrofuran is added dropwise. The reaction is allowed to warm slowly to room temperature and stirred for 18 h. The reaction mixture is concentrated in vacuo. The residue is taken up in 100 mL of dichloromethane and filtered. The filtrate is chromatographed twice, eluting with 5% methanol/dichloromethane. Fractions homogeneous by TLC are combined and concentrated in vacuo to yield a pale yellow solid. The solid is recrystallized from ethyl acetate to yield 0.298 g of the title compound as a white crystalline solid.

10 **EXAMPLE 3** N-[(4-Chlorophenyl)methyl]-8-fluoro-4,6-dihydroxy-3-quinoline-carboxamide

15

To a mixture of 10% Pd/C and 2.0 g of 3-fluoro-4-nitrophenol in 10 mL of tetrahydrofuran and 10 mL of methanol is added 4.817 g of ammonium formate.

After the reaction stirred at room temperature for 1 h, it is filtered through celite and condensed. To the residue is then added 2.57 mL of

20 diethylethoxymethylenemalonate and 10 mL xylene. The mixture is heated to 135 °C for 1 h with a Dean-Stark trap to remove formed ethanol. The reaction is cooled. The resulting solid is collected, washed with hexanes, and dried. The solid is then dissolved in 50 mL of diphenyl ether and heated to 250 °C for 3 h with a Dean-Stark trap to collect ethanol. The solution is cooled and diluted with hexanes. The
25 resulting solid is collected and dried to yield 0.527 g. A solution of 0.415 g of that solid in 4 mL of 4-chlorobenzylamine is heated to 180 °C for 1 h. The solution is cooled and diluted with diethyl ether. The resulting solid is collected and recrystallized from acetone/hexanes to yield 0.226 g of the title compound as a tan solid.

5 A mixture of 9.50 g of 4-bromo-2-fluoroaniline and 10.81 g diethylethoxy-methylene malonate is heated to 130 °C in a flask equipped with a Dean-Stark trap to collect formed ethanol. The mixture is then cooled to 75 °C and diluted with hexanes. The resulting solid is collected and dried. The solid is then dissolved in 60 mL diphenyl ether and heated to 250 °C for 2 h in a flask equipped with a Dean-
 10 Stark trap to collect the ethanol. The solution is allowed to cool to room temperature and the resulting solid is collected, washed with hexanes and dried to yield 8.69 g. This material (0.49 g) and 5 mL of 4-chlorobenzylamine are heated at 180 °C for 1 h. The reaction is cooled and poured into 80 mL diethyl ether. The resulting solid is filtered and recrystallized from ethyl acetate/hexanes to give the
 15 title compound as an off-white solid (0.35 g).

Physical characteristics are as follows:

25 A mixture of 11.85 g of 2-fluoro-4-iodoaniline and 10.81 g of diethylethoxymethylene malonate is heated to 130 °C in a flask equipped with a Dean-Stark trap to collect formed ethanol. The mixture is then cooled to 75 °C and diluted with hexanes. The resulting solid is collected and dried. The solid is then dissolved in 60 mL diphenyl ether and heated to 250 °C for 3 h in a flask equipped
 30 with a Dean-Stark trap to collect the ethanol. The solution is allowed to cool to room temperature and the resulting solid is collected and dried to yield 11.73 g.

This material (0.55 g) and 3 mL of 4-chlorobenzylamine are heated at 180 °C for 1 h. The reaction is cooled and poured into 75 mL diethyl ether. The resulting solid is filtered and recrystallized from ethyl acetate/hexanes to give the title compound as an off-white solid (0.45 g).

EXAMPLE 8 N-[(4-Chlorophenyl)methyl]-4-hydroxy-5,7-bis(trifluoromethyl)-3-
quinolinecarboxamide

A mixture of 0.35 g of ethyl 4-hydroxy-5,7-bis(trifluoromethyl)-3-

quinolinecarboxylate (FR 2537140) and 3.0 mL of 4-chlorobenzylamine is stirred 1 h at 200 °C. The mixture is cooled to 25 °C and it is diluted with 25 mL of hexanes. After stirring for an additional 1 h the solid precipitate is collected by filtration and washed with 10 mL of hexanes. It is dried in a stream of air and then it is
5 suspended in 20 mL of glacial acetic acid. The mixture is heated until the solid is completely dissolved and the resulting solution is diluted with 200 mL of distilled water. The mixture is allowed to cool to 25 °C and the solid is collected by filtration. It is washed with a small volume of 10% aqueous acetic acid and then it is dried at 20 torr and 45 °C for 18 h. The yield is 0.23 g.

To a suspension of 6.0 g of ethyl 5,8-difluoro-4-hydroxy-3-quinolinecarboxylate (Magn. Reson. Chem., 34, 972-978 (1996)) in 400 mL of a 1 : 1 (v/v) mixture of methanol and tetrahydrofuran is added 100 mL of a 1.0 M aqueous solution of lithium hydroxide. After three days an additional 20 mL of 1.0 M aqueous lithium hydroxide solution is added and the mixture is warmed to 50 °C. After an additional three days the solution is cooled to 25 °C and it is diluted with 15 mL of glacial acetic acid. The volume of the solution is reduced by two-thirds by evaporation at reduced pressure. The precipitate is collected by filtration and it is washed with four successive 150 mL portions of distilled water. The solid is dried at 80 °C and 20 torr for 24 h. This procedure yields the title compound as 4.96 g of an off-white solid.

EXAMPLE 21 6-Chloro-N-[(4-chlorophenyl)methyl]-4-hydroxy-3-quinoline-carboxamide

30

To a mixture of 0.365 g of 6-chloro-4-hydroxy-3-quinolinecarboxylic acid (J. Amer. Chem. Soc., 68, 1264 (1946)) and 5 mL of dimethylformamide is added 0.29 g of carbonyldiimidazole. The mixture is stirred 18 h at 60 °C and then it is cooled to 25 °C. To the resulting solution is added 0.22 mL of 4-chlorobenzylamine. After stirring for 18 hours the mixture is diluted with 10 mL of distilled water. After 30 minutes the precipitate is collected by filtration and it is washed with two successive

10 mL portions of water. It is then washed with 5 mL of diethyl ether. It is dried for 48 h at 85 °C and 20 torr. This procedure yields the title compound as 251 mg of an off-white solid.

Physical characteristics are as follows:

15

A mixture of 230 mg of ethyl 4-hydroxy-6-methyl-3-quinolinecarboxylate (J. Chem. Soc., 893 (1948)) and 0.7 mL of 4-chlorobenzylamine is stirred for 1 h at 210 °C. The mixture is cooled to 25 °C and it is diluted with 1.5 mL of toluene. The mixture is filtered and the filtrant is dissolved in a minimum volume of refluxing glacial acetic acid. The hot solution is treated with distilled water dropwise until it becomes cloudy, and it is allowed to cool to 25 °C. The precipitate is collected by filtration and it is washed with a small amount of dilute aqueous acetic acid. The solid is dried for 48 h at 20 torr and 85 °C. This procedure gives the title compound as 47 mg of a light tan solid.

Physical characteristics are as follows:

The mixture is cooled to 25 °C and it is diluted with 2.0 mL of toluene. The mixture is filtered and the filtrant is dissolved in a minimum volume of refluxing glacial acetic acid. The hot solution is treated with distilled water dropwise until it becomes cloudy, and it is allowed to cool to 25 °C. The precipitate is collected by filtration and it is washed with a small amount of dilute aqueous acetic acid. It is dried in a stream of air and then it is dissolved in 7 mL of refluxing acetonitrile. The solution is allowed to cool to 25 °C and after an additional 2 h the precipitate is collected by filtration. The solid is dried for 48 h at 20 torr and 85 °C. This procedure gives the title compound as 64 mg of a light tan solid.

Physical characteristics are as follows:

PREPARATION 9 6-Cyano-4-hydroxy-3-quinolinecarboxylic acid

25

To a suspension of 5.15 g ethyl 6-cyano-4-hydroxy-3-quinolinecarboxylate (FR 2002888) in 212 mL of a 1 : 1 (v/v) mixture of methanol and tetrahydrofuran is added 53 mL of a 1.0 M aqueous solution of lithium hydroxide. After 24 h an additional 50 mL of 1.0 M aqueous lithium hydroxide solution is added and the mixture is stirred for 24 additional hours. It is neutralized by dropwise addition of 3.0 N hydrochloric acid. The volume of the solution is reduced by two-thirds by evaporation at reduced pressure. The precipitate is collected by filtration and it is washed several portions of distilled water. This procedure gives the title compound as 3.39 g of a white solid.

Physical characteristics are as follows:

¹H NMR (DMSO) δ 8.85, 8.55, 7.87, 7.79.

MS (ES-) m/z 213 (M-H⁺, 100%).

EXAMPLE 24 N-[(4-Chlorophenyl)methyl]-6-cyano-4-hydroxy-3-quinoline-carboxamide

10

A suspension of 0.25 g of 6-cyano-4-hydroxy-3-quinolinecarboxylic acid in 5 ml of thionyl chloride is treated with one drop of dimethylformamide. The mixture is stirred 24 h at 25 °C and then the excess thionyl chloride is evaporated in a stream of nitrogen. The final traces of thionyl chloride are removed at high vacuum (0.05 torr) and the solid is suspended in 5 ml of dichloromethane. The suspension is treated with 0.46 mL of 4-chlorobenzylamine and the resulting mixture is stirred for two weeks at 25 °C. The mixture is partitioned between 50 ml of ethyl acetate and 50 mL of a solution prepared by diluting a saturated aqueous solution of sodium dihydrogen phosphate with an equal volume of distilled water. The organic phase is washed with an additional 50 mL of this buffer and then it is washed with brine. The solution is dried (MgSO_4) and the solvent is evaporated at reduced pressure. The residual oil is treated with 10 mL of diethyl ether which causes the oil to crystallize. The solid is collected by filtration and it is washed with a minimum volume of ethyl acetate. The solid is dissolved in 1.5 mL of refluxing glacial acetic acid and the resulting solution is diluted with 3 mL of distilled water. The mixture is allowed to cool to 25 °C and the pale yellow solid which precipitated is collected by filtration. The solid is washed with 1.0 mL of 50% aqueous acetic acid and it is dried in a stream of air. The title compound is thus obtained as 50 mg of a pale yellow solid.

15

To a mixture of N-[(4-chlorophenyl)methyl]-8-fluoro-4-hydroxy-6-iodo-3-quinolinecarboxamide of Example 5 (0.466 g) in 15 mL diethylamine is added CuI (0.010 g) and (Ph₃P)₂PdCl₂ (0.035 g). Propargyl alcohol (0.058 mL) is then added and
20 the reaction is stirred overnight at room temperature. The diethylamine is removed in vacuo. The residue is partitioned between EtOAc and water. The insoluble material is filtered off and saved. The organic layer is washed with brine, dried and condensed. The residue is combined with the insoluble material and adsorbed onto silica and chromatographed, eluting with 3% MeOH/CH₂Cl₂. Fractions homogeneous
25 by TLC are combined and condensed to yield 0.192 g of the desired product as a tan solid.

5 To a solution of ethyl 8-fluoro-4-hydroxy-6-iodoquinolone-3-carboxylate (1.5 g) in 60 mL of 1:1 MeOH:THF is added 16 mL of 1M LiOH. The reaction is maintained at 40°C overnight. The reaction mixture is cooled to room temperature, then diluted with 40 mL glacial acetic acid. The resulting precipitate is collected, washed with H₂O, and dried to yield 0.890 g of 8-fluoro-6-iodoquinoline-3-carboxylic acid as a white solid. This acid (0.25 g) and 1,1'-carbonyldiimidazole (0.146 g) are dissolved in 25 mL anhydrous THF and heated at 65°C for 3 days. After the reaction mixture is cooled to room temperature, 4-chlorophenylhydrazine (0.161 g) and diisopropylethylamine (0.16 mL) are added. The reaction mixture is heated at 65°C overnight to solubilize the reactants. The mixture is cooled to room temperature and partitioned between EtOAc and H₂O. The aqueous layer is extracted with EtOAc (2X). The combined organic layers are washed with brine (1X), dried over Na₂SO₄, and condensed. The crude product is recrystallized with EtOAc/hexanes to yield 0.13g of the desired product as an off-white solid.

A mixture of 0.15 g of 4-hydroxy-6-[(phenylmethyl)thio]-7-(trifluoromethyl)-3-quinolinecarboxylic acid and 1.2 mL of dimethylformamide is treated with 0.075 g of carbonyldiimidazole. The mixture is stirred 20 h at 35 - 40 °C. The solution is cooled to 25 °C and it is treated with 0.075 mL of distilled water and then it is stirred for 10 min. The solution is treated with 0.053 mL of 4-chlorobenzylamine and it is stirred for 18 h. The mixture is diluted with 1.0 mL of distilled water and then it is decanted from a dark, oily precipitate. This precipitate is treated with 1 mL of glacial acetic acid and the mixture is shaken for 5 min. The solid which formed is collected by filtration and it is washed with a few mL of 50% aqueous acetic acid. The solid is dried in a stream of air to give 48 mg of the title compound.

The organic layer is washed with brine (10 mL), dried (MgSO₄), and concentrated. The crude product is purified by column chromatography (heptane/ethyl acetate, 4/1; 3/1) to afford *N*-((4-chlorophenyl)methyl)-6,8-difluoro-7-methoxy-4-oxo-1-(2-(trimethylsilyl)ethoxy)methyl-3-quinolinecarboxamide. The resulting crude amide is suspended in ethanol (15 mL), heated to 85 °C, and to the mixture is added 50% aq. hydrochloric acid (5 mL). The mixture is heated an additional 1.5 h and allowed to cool to rt. The reaction mixture is neutralized with solid sodium bicarbonate and filtered. The solids are washed with ethanol (10 mL) followed by ethyl acetate (20 mL), and the combined filtrates are concentrated to afford a tan solid. The crude product is purified by recrystallization from acetic

acid/water followed by column chromatography (heptane/2-propanol, 95/5) to afford 27 mg of the title compound.

Ethyl 4-hydroxy-6-iodo-3-quinolonecarboxylate (1.4 g) is dissolved in 60 mL of 1:1 MeOH:THF and 16 mL 1M LiOH. The reaction is heated at 40 °C overnight. Upon diluting the reaction mixture with 25 mL acetic acid, a white precipitate forms. The solid is filtered, washed with water, and dried to obtain 1.09 g of the desired acid as a white solid.

The acid from above (250 mg) and 1,1'-carbonyldiimidazole (154.4 mg) are dissolved in 25 mL anhydrous THF and heated at 65 °C for 2 days. After the reaction mixture is cooled to room temperature, 4-chlorobenzylamine (170.5 mg) and diisopropylethylamine (0.17 mL) are added. The reaction mixture is heated at 65 °C overnight to solubilize the reactants and an additional 20 mL THF is also added. The mixture is cooled to room temperature and partitioned between EtOAc and H_2O . The aqueous layer is extracted with EtOAc (2X). The combined organic layers are washed with brine (1X), dried over Na_2SO_4 , and condensed. The crude solid is recrystallized with EtOAc/hexanes and filtered to obtain a product of very low yield.

After storing the filtrate in the freezer for 1 month, a pure solid precipitates and is filtered to yield 25.5 mg of the desired product as a pink solid.

To a solution of the title compound Example 39 (1.0 g) in 30 mL freshly distilled tetrahydrofuran is added KCN (0.30 g) and $\text{Pd}(\text{PPh}_3)_4$ (0.49 g). The reaction is heated at 60 $^{\circ}\text{C}$ overnight. The reaction is cooled to room temperature and the solvents removed. The residue is dissolved in a mixture of MeOH/ CH_2Cl_2 /EtOAc and adsorbed onto silica. Purification by a Biotage Flash 40S

silica gel column (eluent 2% MeOH/CH₂Cl₂) affords the desired product as a yellow solid (0.52 g).

A solution of the solid obtained above (0.52 g) and NEt₃ (0.44 mL) in 10 mL DMF is heated to 95 °C. H₂S is bubbled into the reaction mixture for approximately 4 hours. The bubbler is removed and the reaction allowed to stir at 30 °C over 3 days. Water is added to the reaction and the resulting solid is filtered and dried. This solid is confirmed to be starting material so the solid is re-dissolved in DMF and subjected to the same reaction conditions. The solid obtained after water is added to the reaction mixture contains desired product. The solid is dissolved in MeOH/CH₂Cl₂ and adsorbed onto silica. A Biotage Flash 40S silica gel column (eluent 2.5% MeOH:CH₂Cl₂ (1L) followed by 4% MeOH:CH₂Cl₂ (1L)) affords the desired product (0.38 g).

The reaction is cooled to room temperature and heptane and ethyl acetate are added. The reaction mixture is allowed to stand at room temperature overnight. The resulting precipitate is filtered off and triturated with ethyl acetate to yield the 0.572 g (32%) of the ester as an off-white solid. The

ester (0.517 g) and 4-chlorobenzylamine (1.60 mL) are combined and heated to 190 °C for 1 h. The reaction is cooled to room temperature and ethyl acetate and heptane are added. The mixture is allowed to stand in the freezer for 3 d. The resulting precipitate is filtered off and recrystallized from ethyl acetate/heptane to yield 0.479 g (75%) of the amide as an off-white solid. This material (0.402 g) is dissolved in 25% dichloromethane/methanol (60 mL) and hydrogenated over 10% Pd/C (80 mg) at 35 psi for 45 min. The reaction mixture is filtered through a Celite pad and the filtrate is concentrated in vacuo. The resulting yellow oil is purified by column chromatography (dichloromethane; dichloromethane/methanol, 99/1; dichloromethane/methanol, 98/2). Fractions homogeneous by TLC are combined and concentrated in vacuo to yield a white solid which is recrystallized from ethyl acetate/methanol to yield 0.163 g (50%) of the title compound as a white, crystalline solid.

15 **EXAMPLE 139** *N*-(4-Chlorobenzyl)-8-fluoro-4-hydroxy-6-(3-oxopropyl)-3-quinolinecarboxamide

20

To a solution of *N*-(4-chlorobenzyl)-8-fluoro-4-hydroxy-6-iodo-3-quinolinecarboxamide from Example No. 5 (0.39 g), CuI (0.043 g), and $\text{Pd}(\text{PPh}_3)_2\text{Cl}_2$ (0.013 g) in 10 mL diethylamine was added propionaldehyde diethyl acetal (0.13 mL). The reaction was stirred at room temperature overnight. The reaction was
25 partitioned between EtOAc and water. The organic layer was washed twice with water, then dried over MgSO_4 , filtered and adsorbed onto silica. A Biotage Flash 40S chromatography column (eluent 3% $\text{MeOH}:\text{CH}_2\text{Cl}_2$ (1L)) afforded the acetylenic intermediate as a solid which was further purified by recrystallization from $\text{CH}_2\text{Cl}_2/\text{hexanes}$ (0.17 g, 42%). The product from above (0.099 g) was dissolved in 30
30 mL EtOAc (0.5 mL pyridine added to aid dissolution). Et_3N (0.030 mL) followed by 10% Pd/C (0.030 g) was added and the reaction placed under hydrogen balloon atmosphere. After 3.5 h, the reaction was filtered over Celite. The filter cake was rinsed thoroughly with EtOAc. The filtrate was concentrated under reduced pressure to give a residue which was recrystallized with $\text{CH}_2\text{Cl}_2/\text{hexanes}$. The
35 intermediate straight-chain acetal was obtained as a white solid (0.063 g, 62%). The product from above (0.11 g) was stirred in a solution of 20 mL 1:1 3N HCl:THF. The

reaction was allowed to stir overnight. The reaction was partitioned between EtOAc and H₂O. A solid which did not dissolve in either layer was filtered (A). The aqueous layer was then extracted 2X with EtOAc and 1X with CH₂Cl₂. The combined organic layers were dried over MgSO₄, filtered and concentrated under reduced pressure to give a white solid (B). Both solid A and solid B are desired product as evidenced by NMR. The total yield of product was 0.056 g (58%).

EXAMPLE 140 *N*-(4-Chlorobenzyl)-4-hydroxy-7-(4-hydroxybutyl)-3-quinolinecarboxamide

20

A solution of *N*-(4-chlorobenzyl)-4-hydroxy-7-iodo-3-quinolinecarboxamide from Example No. 39 (0.646 g), 3-buten-1-ol (0.16 mL), PdCl₂(PPh₃)₂ (26.0 mg), and 0.93 mL DMF was heated at 90 °C for 1 hr. The reaction mixture was cooled to room temperature and partitioned between EtOAc and H₂O. An orange solid precipitated from the organic layer and was filtered and collected to obtain pure product as indicated by NMR. The aqueous layer was washed with EtOAc (3X). The combined organic layers were dried over Na₂SO₄ and condensed to obtain an orange-brown residue. The residue was adsorbed onto silica and chromatographed eluting with 4% MeOH in CH₂Cl₂. Fractions homogenous by TLC were combined, condensed, and recrystallized from EtOAc/hexanes to obtain a white solid. The two crops yielded 0.412 g (74%) of the desired product as an orange and white solid. A mixture of the acetylene from above (300 mg) and Pd/C (10%, 60.0 mg) was dissolved in 3:1 CH₂Cl₂:MeOH. The reaction mixture was placed under the Parr hydrogenator and monitored with the OAMS for complete reduction of the acetylene. After 1 hr OAMS showed that complete reduction had not been achieved. The old

palladium catalyst was replaced with fresh palladium catalyst (60.0 mg) and placed under the Parr hydrogenator for another hour. The reaction was completed in a total of 2 hrs and filtered over celite to remove the palladium. The filtrate was condensed to obtain a yellow solid. The crude product was adsorbed onto silica and chromatographed eluting with 4% MeOH in CH₂Cl₂. Fractions homogenous by TLC were condensed and recrystallized with EtOAc/hexanes to yield 186.2 mg (61%) of the desired product as a white solid.

Methyl 3-[[[(4-chlorobenzyl)aminocarbonyl]-8-fluoro-4-hydroxy-6-quinolinecarboxylate from Example No. 109 (150 mg) was dissolved in distilled THF (45 mL). The solution was heated to 35 °C to get the starting material into solution, then cooled to 18 °C for addition of LiAlH₄ (27.0 mg). After 2 hours additional LiAlH₄ (27.0 mg) was added because not much progress was seen in complete conversion to product. Complete conversion to product was achieved in 6 1/2 hrs. The reaction was quenched by adding 0.1 mL H₂O, 0.1 mL 15% NaOH, and 0.1 mL to the reaction mixture. The reaction mixture was filtered to get rid of the aluminum salt that had precipitated. The filtrate was condensed to obtain a green residue. The green residue was adsorbed onto silica and chromatographed eluting with 2% MeOH in CH₂Cl₂ and 3% MeOH in CH₂Cl₂. The reaction mixture is filtered over celite to remove the palladium. The filtrate is condensed to yield a solid. The crude product is adsorbed onto silica and chromatographed eluting with 10% MeOH in CH₂Cl₂. Fractions homogenous by TLC are combined and condensed to afford 55.3 mg (33%) of ethyl 4-hydroxy-6-([2-hydroxy-1-(hydroxymethyl)ethoxy]methyl)-3-quinolinecarboxylate as a white solid. Ethyl 4-hydroxy-6-([2-hydroxy-1-(hydroxymethyl)ethoxy]methyl)-3-quinolinecarboxylate (53.1 mg) and 4-chlorobenzylamine (0.30 mL) are heated neat at 180 °C for 1 h. The reaction is cooled to room temperature and partitioned between CH₂Cl₂ and H₂O (2X). The organic layers are combined, dried over Na₂SO₄, and condensed to afford a yellow residue. The residue is chromatographed eluting with 5% MeOH in CH₂Cl₂. Fractions homogenous by TLC are combined and condensed to yield 18.8 mg (27%) of the title compound as a creme solid.

30

In a flame-dried 1L 3-necked roundbottom, methyl 3-[[[(4-chlorobenzyl)amino]carbonyl]-4-hydroxy-6-quinolinecarboxylate from Example No. 165 (3.0 g) is
35 dissolved in 700 mL distilled THF. The suspension is heated to 67 °C to solubilize the starting material. The reaction is allowed to cool to room temperature and then

cooled in an ice bath to 10 °C. Lithium aluminum hydride (552.2 mg) is added in one portion. The reaction is stirred at 25 °C and monitored by mass spectroscopy for conversion to desired product. The reaction is quenched by adding 2 mL H₂O, 2 mL 15% NaOH, and 2 mL H₂O to the reaction mixture. The reaction mixture is filtered
5 to remove the aluminum salt that had precipitated. The filtrate is condensed to obtain a yellow-green residue. The residue is adsorbed onto silica and chromatographed eluting with 2% MeOH in CH₂Cl₂ (1L), 3% MeOH in CH₂Cl₂ (2L), 4% MeOH in CH₂Cl₂ (2L), 5% MeOH in CH₂Cl₂ (1L), 6% MeOH in CH₂Cl₂ (1L), and 7% MeOH in CH₂Cl₂ (2L). The desired product elutes with 4-7% MeOH in CH₂Cl₂.

35

5 Sodium hydroxide (6.22 g) is added to a solution of *p*-nitrophenol (21.45 g) in DMF (300 mL) and stirred until the reagents are fully dissolved. After a dropwise addition of 2-chloroethanol (10.66 ml), the reaction mixture is heated to 100 °C for 72 hours. After filtering and evaporating the solvent under reduced pressure, the resulting oil is recrystallized in a methanol/water mixture and filtered to afford

10 21.62 g (92%) of 2-(4-nitrophenoxy)-1-ethanol. A mixture of 2-(4-nitrophenoxy)-1-ethanol (6.17 g) and palladium on carbon (0.08 g) in EtOH (120 mL) is hydrogenated in a 500 mL Parr jar at 33 psi for 18 hrs. Vacuum filtration through celite and evaporation under reduced pressure affords 5.00 g (96%) of 2-(4-aminophenoxy)-1-ethanol. This material is combined with diethyl ethoxymethylenemalonate (7 mL)

15 and heated to 130 °C for 1 hr in a round bottom flask under a gentle stream of nitrogen. The mixture is cooled, diluted with 1:1 cyclohexane/toluene (20 mL), and filtered to afford 9.1 g (86%) of diethyl 2-[[4-(2-hydroxyethoxy)anilino]methylene]malonate. A solution the resulting malonate (8.59 g) in acetic acid (15 mL) and acetic anhydride (4 mL) is heated to 60 °C for 36 hrs. The reaction mixture is

20 diluted with water, extracted with ethyl acetate and washed with saturated sodium bicarbonate. Evaporation under reduced pressure leaves a brown oil which is recrystallized from 1:1 methanol/water and filtered to afford 7.09 g (73%) diethyl 2-((4-[2-(acetyloxy)ethoxy]anilino)methylene)malonate. Diethyl 2-((4-[2-(acetyloxy)ethoxy]anilino)methylene)malonate (6.55 g) is dissolved in diphenyl ether

25 (75 mL) and refluxed at 250 °C for 1 hr. After the mixture is cooled and diluted with 250 mL toluene, the resulting precipitate is collected by filtration, washed with toluene and recrystallized from aqueous acetic acid. This procedure yielded 0.50 g (9%) of ethyl 6-[2-(acetyloxy)ethoxy]-4-hydroxy-3-quinolinecarboxylate. The resulting carboxylate ester (0.49 g) and 4-chlorobenzylamine (0.90 mL) are heated to 175 °C

30 for 2 hrs. After the reaction mixture is cooled and diluted with xylenes, the dark solid is filtered. Recrystallization from acetic acid and water affords 0.150 g (26%) of the title compound as a beige solid.

PREPARATION 23 4-(Aminomethyl)benzonitrile

A mixture of 4-(bromomethyl)benzonitrile (7.1 g) and sodium azide (2.6 g) in DMF (40 mL) is stirred for 19 hrs. The reaction mixture is then diluted with water (150 mL) and extracted with ether (2 x 50 mL). The organic phases are combined, washed with water (50 mL) and brine (50 mL), and dried with MgSO_4 . Filtration and evaporation of the solvent leaves 5.5 g of 4-(azidomethyl)benzonitrile as a clear, colorless oil.

Triphenylphosphine (7.67 g) is added to a solution of 4-(azidomethyl)benzonitrile (4.19 g) in THF (30 mL) and stirred for 1 hr. Water (10 mL) is added, and the solution is stirred for 16 hrs. The reaction mixture is diluted with ether (50 mL) and extracted with HCl (3 N, 3 x 25 mL) and water (1 x 25 mL). The aqueous phases are combined and washed with ether (50 mL). Sodium hydroxide is added until the pH = 12. After extracting with ether (2 x 50 mL), the solution is dried with MgSO_4 and filtered. The solvent is evaporated under reduced pressure. The resulting crude mixture is then purified via bulb to bulb distillation at 150 °C and 1 torr to afford 1.74 g (50%) of the title compound as a clear, colorless oil.

Physical characteristics are as follows:

^1H NMR ($\text{DMSO}-d_6$) 7.7, 7.5, 3.8, 1.9.

10

To a solution of 22.2 g of 2-fluoroaniline in 100 mL of acetic acid is added 32 g of ammonium thiocyanate. The flask is immersed in an ice bath and the mixture stirred during the dropwise addition of 32 g of bromine in 40 mL of acetic acid. After the addition, which takes *ca* 40 min., the mixture is stirred for 1 h at 0°C and them dumped into 700 mL of rapidly stirred icewater. Conc. aqueous ammonia is added to neutralize HBr and bring the pH of the mixture to 4.0. The resulting yellow solid is filtered, washed well with water, and dried *in vacuo* to provide 27.72 g of 4-amino-3-fluorobenzenesulfenyl cyanide as a pale yellow solid.

A stirred biphasic mixture of 3.36 g of 4-Amino-3-fluorobenzenesulfenyl cyanide and 4.8 g of 50% aq. NaOH in 40 mL of THF and 20 mL of water is refluxed under argon for 1 h. Benzyl chloride (2.8 mL) is then added, and refluxing continued for 16 h. The mixture is then partitioned between water and ether, and the organic phase washed with water and brine, dried (Na_2SO_4), and concentrated under reduced pressure to give 5.8 g of yellow oil. Flash chromatography on silica using 20% EtOAc in heptane provides 3.59 g of 4-(benzylsulfanyl)-2-fluoroaniline as a yellow oil.

A neat mixture of 3.58 g of compound of 4-(benzylsulfanyl)-2-fluoroaniline and 3.48 g of diethyl ethoxymethylenemalonate is heated at 135°C under a slow argon sweep for 1 h, then diluted with 25 mL of diphenyl ether and heated to 260°C, with maintenance of the argon sweep, and kept at that temperature for 90 min. The mixture is then cooled to *ca* 100°C and added to 300 mL of stirred heptane. The precipitate is filtered, washed with heptane, and dried *in vacuo* to provide 4.01 g of ethyl 6-(benzylsulfanyl)-8-fluoro-4-hydroxy-3-quinolinecarboxylate as a yellow solid.

A solution of 3.93 g of of ethyl 6-(benzylsulfanyl)-8-fluoro-4-hydroxy-3-

quinolinecarboxylate in 8.8 g of 4-chlorobenzylamine is heated at 165°C under argon for 16 h, then cooled and diluted with CHCl_3 and MeOH. The solution is washed with dil. HCl, dried (Na_2SO_4), and concentrated under reduced pressure to a yellow solid. Flash chromatography on silica using 3-6% MeOH in CH_2Cl_2 affords 4.73 g (95%) of 6-(benzylsulfanyl)-*N*-(4-chlorobenzyl)-8-fluoro-4-hydroxy-3-quinolinecarboxamide as a yellow solid.

Into 10.0 mL of glacial acetic acid, contained in a tared scintillation vial cooled in an ice bath, is bubbled chlorine gas. After ca 3-5 min., 1.32 g of Cl_2 has been absorbed, giving an approximate concentration of 1.8 M. A solution of 330 mg of 6-(benzylsulfanyl)-*N*-(4-chlorobenzyl)-8-fluoro-4-hydroxy-3-quinolinecarboxamide in 10 mL of acetic acid and 1.0 mL of water is prepared with the aid of heat, and this solution is cooled to 0°C for the addition of 1.4 mL of the freshly prepared chlorine solution. The solution is stirred for 15 min at 0°C, then added to 50 mL of ether. Volatiles are removed under reduced pressure, and toluene (50 mL) is added to the residue. Concentration of this solution under reduced pressure affords 337 mg of the sulfonyl chloride as a yellow solid of sufficient purity for sulfonylation of amines.

PREPARATION 27 Parallel Synthesis of Sulfonamides.

Amines (0.2 mmol each) are dissolved or suspended in 0.25 mL aliquots of
 5 pyridine in screw-capped vials. Liquid amines are dispensed by volume; solids by
 weight. In cases where amine salts are used, 34 μ L of diisopropylethylamine per
 equivalent of acid is added. Into each vial is introduced 22 ± 1 mg (50 μ mol) of
 sulfonyl chloride of Formula K-5, and the vials are placed on a rocker for 4-20 h. At
 the end of the reaction time, each solution is added dropwise to 1.6 mL of rapidly
 10 stirred 2N HCl. The mixtures are stirred vigorously for 5 min, then filtered through
 plastic Burdick & Jackson fritted SPE reservoirs. The solids are washed well with
 water and dried under vacuum to provide the coupled products. The following
 examples were prepared according to this procedure.

10

To a stirred mixture of 78 mg of *N*-(4-chlorobenzyl)-8-fluoro-4-hydroxy-6-(3-hydroxypropyl)-3-quinolinecarboxamide from Example No. 110, 27 mg of DMAP, and 0.46 mL of a 0.65 M solution of suleptanic acid triethylammonium salt in acetonitrile, in 1 mL of 1:1 THF-chloroform, was added 38 μ L of diisopropylcarbodiimide. The solution was stirred for 18 h, then concentrated under reduced pressure. Flash chromatography of the residue on silica using 5-15% methanol in dichloromethane provided a solid. This was dissolved in chloroform-butanol-methanol, and the solution stirred with saturated aqueous sodium sulfate. The organic phase was filtered through anhydrous sodium sulfate and concentrated under reduced pressure to afford 121 mg of the title compound as a white solid.

Physical properties as follows:

^1H NMR (CDCl_3) δ 1.1-1.6, 2.0-2.4, 2.8-3.3, 3.7-4.1, 4.7, 6.8, 7.3, 8.0, 8.1, 8.8 ppm.

PREPARATION 28 3-(Benzylsulfanyl)aniline

To a cold (0°C), stirred slurry of 1.7 g of sodium hydride oil dispersion (60%)
5 in 100 mL of dry THF, under argon, is added *via* cannula 4.95 g of 3-aminothio-
phenol in 5 mL of THF. After 5 min, 4.6 mL of benzyl chloride is added. The
mixture is allowed to warm to room temperature and stirred for 18 h, then cooled to
0°C and partitioned between water and diethyl ether. The organic phase is washed
with water and brine, dried (Na₂SO₄), and concentrated under reduced pressure.
10 Flash chromatography of the residual oil on silica using 30% ethyl acetate in

7.70 g of diethyl ethoxymethylene malonate is heated at 135°C under a gentle flow
20 of argon for 2 h, then diluted with 30 mL of diphenyl ether and heated to 260-270°C.
After 45 min, the solution was added to 500 mL of stirred heptane. The resulting
solid was filtered, washed well with hexane, and dried under vacuum to afford 8.32
g of the title compound.

Physical properties as follows:

25 ¹H NMR (CDCl₃) δ 1.5, 4.4, 4.6, 7.2-7.5, 7.7, 7.8, 8.3, 9.2 ppm.

MS ES+ 340

PREPARATION 30 7-(Benzylsulfanyl)-N-(4-chlorobenzyl)-4-hydroxy-3-quinoline-
carboxamide

A mixture of 4.07 g of ethyl 7-(benzylsulfanyl)-4-hydroxy-3-quinoline-
30 carboxylate from Preparation No. 29 and 8.5 g of 4-chlorobenzylamine is heated at
165°C for 18 h, then cooled and partitioned between 1 N HCl and chloroform-
methanol. The organic phase is dried (MgSO₄) and concentrated under reduced
pressure, and the residue flash chromatographed on silica using 2-5% methanol in
dichloromethane to provide 4.82 g of the title compound.

35 Physical properties as follows:

¹H NMR (CDCl₃) δ 4.13, 4.6, 7.1-7.4, 8.2, 8.6 ppm.

MS ES+ 435

PREPARATION 31 3-[[[4-Chlorobenzyl)amino]carbonyl]-4-hydroxy-7-quinolinesulfonyl chloride

Into 10.0 mL of glacial acetic acid, contained in a tared scintillation vial
5 cooled in an ice bath, is bubbled chlorine gas. After *ca* 3-5 min., 1.29 g of Cl₂ has been absorbed, giving an approximate concentration of 1.8 M. A solution of 306 mg of 7-(benzylsulfanyl)-*N*-(4-chlorobenzyl)-4-hydroxy-3-quinolinecarboxamide from Preparation No. 30 in 10 mL of acetic acid and 1.0 mL of water is prepared with the aid of heat, and this solution is cooled to 0°C for the addition of 1.8 mL of the
10 freshly prepared chlorine solution. The solution is stirred for 15 min at 0°C, then added to 50 mL of ether. Volatiles are removed under reduced pressure, and toluene (50 mL) is added to the residue. Concentration of this solution under reduced pressure affords 344 mg of the sulfonyl chloride as a yellow solid of sufficient purity for sulfonylation of amines.

15 Physical properties as follows:

MS (ES-) 409, 411

EXAMPLE 277 *N*-(4-Chlorobenzyl)-4-hydroxy-7-[[[1-naphthylmethyl)amino]-sulfonyl]-3-quinolinecarboxamide

20

To a stirred solution of 44 µL of 1-naphthylmethylamine and 51 µL of
25 diisopropylethylamine in 0.5 mL of pyridine is added 100 mg of 3-[[[4-chlorobenzyl)amino]carbonyl]-4-hydroxy-7-quinolinesulfonyl chloride from Preparation No. 31. After 18 h, the solution is added to 3.5 mL of rapidly stirred 2 N HCl, and the resulting solid is filtered, washed well with water, and dried under vacuum. Flash chromatography of the solid on silica gel using 2-5% methanol in
30 dichloromethane provides 48 mg of the title compound as a white solid.

Physical properties as follows:

¹H NMR (CDCl₃) δ 4.70, 4.79, 7.2-7.5, 7.6, 7.8, 8.2, 9.5 ppm.

EXAMPLE 278 *N*-(4-Chlorobenzyl)-4-hydroxy-7-(methylsulfanyl)-3-quinolinecarboxamide

35

5 A neat mixture of 2.8 g of compound of 3-methylthioaniline and 4.0 g of diethyl ethoxymethylenemalonate is heated at 135°C under a slow argon sweep for 1 h, then diluted with 25 mL of diphenyl ether and heated to 260°C, with maintenance of the argon sweep, and kept at that temperature for 90 min. The mixture is then cooled to *ca* 100°C and added to 300 mL of stirred 1:1 ether-hexane. The precipitate
10 is filtered, washed with hexane, and dried in vacuo to provide 1.35 g of crude material as a tan solid, which is recrystallized from acetic acid-water to afford 1.06 g of ethyl 4-hydroxy-7-(methylsulfanyl)-3-quinolinecarboxylate.

A solution of 50 mg of ethyl 4-hydroxy-7-(methylsulfanyl)-3-quinolinecarboxylate in 200 μ L of 4-chlorobenzylamine is heated at 190°C under argon for 16
15 h, then cooled and diluted with CHCl_3 and MeOH. The solution is washed with dil. HCl, dried (Na_2SO_4), and concentrated under reduced pressure to a yellow solid. Flash chromatography on silica using 2-4% MeOH in CH_2Cl_2 affords 62.4 mg (92%) of *N*-(4-chlorobenzyl)-4-hydroxy-7-(methylsulfanyl)-3-quinolinecarboxamide.

Physical properties as follows:

20 $^1\text{H NMR}$ (CDCl_3) δ 2.54, 2.6, 4.63, 7.3, 8.2, 8.6 ppm.

35 R^5 is

- a) H ,

- b) C₁₋₈ alkyl, optionally substituted with one to three -OH, CN, C₁₋₄ alkoxy, halo, -NO₂, het or aryl,
- c) aryl, or
- d) het;

5 R⁶ is

- a) -SO₂C₁₋₆ alkyl,
- b) -SO₂-(CH₂)_m-aryl, or
- c) -SO₂-(CH₂)_m-het;

R⁷ and R⁸ are independently

- 10 a) H,
- b) C₁₋₈ alkyl, optionally substituted with one to three -NO₂, halo, -CN, OR⁵, aryl, het, C₃₋₆ cycloalkyl, C₁₋₆ alkynyl, C₁₋₆ alkenyl, -SR¹⁴, or -NR¹⁶R¹⁷,
- c) aryl,
- 15 d) het,
- e) -(CH₂)_m-C(=O)OR⁵,
- f) -(CH₂)_m-C(=O)R⁵, or
- g) R⁷ and R⁸ taken together to form het;

R⁹ is

- 20 a) -OH, or
- b) -OC₁₋₈ alkyl;

R¹⁰ is

- a) H,
- b) C₁₋₈ alkyl,
- 25 c) -NR⁷R⁸,
- c) C₁₋₈ alkyl substituted with one to two halo, het, -NR⁷R⁸, -COOH -O(CH₂)_mCOOH or -C(=O)N(C₁₋₄ alkyl)(CH₂)_nS(=O)₂OM⁺;

R¹¹ is

- a) C₁₋₈ alkyl,
- 30 b) C₁₋₈ alkyl substituted with one to three -CN, halo, -NO₂, -COOR⁵, -C(=O)R⁵, -SR⁵, aryl, -OR⁵, -NR⁷R⁸, -OP(=O)(R⁹)₂, -OPH(=O)R⁹ -OC(=O)R¹⁰, -O-glycyl, -O-valyl or -O-lysyl or
- c) -(CH₂)_m-het;

R¹² is

- 35 a) H,
- b) -CN,

- c) C₁₋₈ alkyl,
 d) C₁₋₈ alkyl substituted with one to three -CN, halo, -NO₂, -C(=O)R⁵,
 -COOR⁵, aryl, het, -SR⁵, -OR⁵, -NR⁷R⁸, -OP(=O)(R⁹)₂ or -OPH(=O)R⁹,
 e) -C(=O)R⁵, or
 5 f) -COOR⁵;

R¹³ is

- a) C₁₋₈ alkyl,
 b) C₁₋₈ alkyl substituted one to three -CN, halo, -NO₂, -C(=O)R⁵, het,
 aryl, -COOR⁵, -SR⁵, -OR⁵ or -NR⁷R⁸,
 10 c) het,
 d) aryl,
 e) -NR⁷R⁸,
 f) OR⁵,
 h) halo;

15 R¹⁴ is

- a) C₁₋₈ alkyl, or
 b) C₁₋₈ alkyl substituted with one to three -CN, halo, -NO₂, -C(=O)R⁵,
 -COOR⁵, het, aryl, -OR⁵, or -NR⁷R⁸;

R¹⁵ is

- 20 a) -NH₂, or
 b) -NHNH₂;

R¹⁶ and R¹⁷ is independently

- a) H,
 b) C₁₋₄ alkyl,
 25 b) -C(=O)C₁₋₄ alkyl, or
 c) -C(=O)-(CH)_m-aryl;

aryl is phenyl or naphthyl, optionally substituted with R¹⁸;

het is a 5-, 6- or 7-membered saturated or unsaturated heterocyclic ring having 1-3
 heteroatoms selected from the group consisting of nitrogen, oxygen and sulfur,

- 30 wherein the heterocyclic ring is optionally fused to a benzene ring, wherein aryl, het
 and benzene ring are optionally substituted with R¹⁸;

R¹⁸ is

- a) halo,
 b) -NO₂,
 35 c) phenyl, optionally substituted with one to five -OH, -CN, halo, -NO₂,
 C₁₋₆ alkyl, het, or OC₁₋₄ alkyl,

- d) C₁₋₈ alkyl, optionally substituted with one to three halo, -CN, -NO₂, aryl, -SR⁵, -OR⁵ or -NR⁷R⁸,
 - e) OR⁵, or
 - f) -SO₂NH₂;
- 5 M is sodium; potassium or lithium atom;
 i is 1 or 2;
 m is 0, 1, 2, or 4;
 n is 1, 2, 3 or 4;
 and with the following provisos:
- 10 (a) where R², R³ and R⁴ are each hydrogen, then R¹ is other than methoxy,
 (b) where R⁴ is Cl, and R² and R³ are each hydrogen, then R¹ is other than methyl,
 (c) where R¹ is hydrogen, R² and R⁴ are each fluoro, R³ is het, then het is other than substituted piperazinyl,
 (d) where R¹ and R³ are each hydrogen, R² is fluoro, then R⁴ is other than fluoro,
- 15 (e) where R² and R⁴ are each hydrogen, R¹ is fluoro, then R³ is other than fluoro,
 (f) where R¹ and R³ are each hydrogen, R² is chloro, then R⁴ is other than chloro,
 (g) where R¹, R² and R³ are each hydrogen, then R⁴ is not bromo,
 (h) where R¹, R³ and R⁴ are each hydrogen, then R² is not trifluoromethoxy,
 (i) where R¹, R² and R⁴ are each hydrogen, then R³ is not trifluoromethoxy, and
- 20 (j) where R¹, R² and R³ are each hydrogen, then R⁴ is not morpholinyl.

2. A compound of claim 1 wherein A is -CH₂-.

- 3 A compound of claim 1 wherein R¹, R², R³ and R⁴ are independently
- 25 a) halo,
 - b) -CN,
 - c) -NO₂,
 - d) phenyl,
 - e) het,
 - 30 f) -OR⁵,
 - g) C₁₋₆ alkyl,
 - h) C₁₋₆ alkyl substituted with one to three -CN, halo, OR⁵, -C(=O)R⁵, het, -COOR⁵, phenyl, -OP(=O)(R⁹)₂, -OPH(=O)R⁹ or -OC(=O)R¹⁰,
 - i) -C≡CR¹¹,

- l) $-SR^{14}$,
 m) $-SO_iR^{13}$,
 n) $-NR^7R^8$,
 o) $-NHSO_iR^{13}$, or
 5 p) R^1 and R^2 taken together are het;
 R^5 is
 a) H,
 b) C_{1-4} alkyl, optionally substituted with one to three -OH, halo, -CN, C_{1-4} alkoxy or phenyl, or
 10 c) phenyl;
 R^7 and R^8 are independently
 a) H,
 b) C_{1-4} alkyl, optionally substituted with one to three $-NO_2$, halo, -CN, OR^5 or phenyl,
 15 c) aryl,
 d) $-(CH_2)_m-C(=O)OR^5$, or
 e) $-(CH_2)_m-C(=O)R^5$;
 R^9 is
 a) -OH, or
 20 b) $-OC_{1-8}$ alkyl;
 R^{10} is
 a) H,
 b) $-NR^7R^8$, or
 c) C_{1-8} alkyl substituted with one to two halo, het, $-NR^7R^8$ or
 25 $-C(=O)N(C_{1-4} \text{ alkyl})(CH_2)_nS(=O)_2O^+M^-$;
 R^{11} is
 a) C_{1-8} alkyl substituted with one to three halo, -CN, $-C(=O)R^5$, phenyl, $-OR^5$, $-NR^7R^8$ or $-OC(=O)R^{10}$;
 R^{12} is
 30 a) -CN,
 b) $-C(=O)R^5$, or
 c) C_{1-4} alkyl substituted with one to three -CN, halo or $-OR^5$,
 R^{13} is
 a) C_{1-4} alkyl,
 35 b) C_{1-4} alkyl substituted with one to three -phenyl, $-OR^5$ or $-NR^7R^8$,
 c) phenyl,

e) $-NR^7R^8$, or

f) OR^5 ;

R^{14} is

a) C_{1-4} alkyl, optionally substituted with phenyl;

5 aryl is phenyl or naphthyl, in each occurrence phenyl is optionally substituted with R^{18} ;

het is pyrrolyl, morpholinyl, thiophenyl, thiazolyl, pyridinyl, thiadiazolyl or

2-oxo-oxazolyl, wherein het is optionally substituted with R^{18} ,

R^{18} is

10 a) halo,

b) phenyl,

c) C_{1-4} alkyl, optionally substituted with one to three halo or OR^5 ; or

d) OR^5 ;

M is sodium, potassium or lithium atom;

15 i is 2;

m is 0, 1, 2, or 4; and

n is 1, 2, 3 or 4.

4. A compound of claim 1 wherein

20 R^1 is H;

R^2 , R^3 and R^4 are independently

a) fluoro,

b) het,

c) $-OR^5$,

25 d) C_{1-6} alkyl substituted with halo, OR^5 , $-C(=O)R^5$, $-OP(=O)(R^9)_2$, het, $-OPH(=O)R^9$ or $-OC(=O)R^{10}$,

e) $-C\equiv CR^{11}$,

f) $-CH=CH-R^{12}$,

g) $-C(=O)R^{13}$, or

30 h) $-NR^7R^8$;

R^5 is

a) H, or

b) C_{1-4} alkyl, optionally substituted with $-OH$, halo or C_{1-4} alkoxy;

R^7 and R^8 are independently

35 a) H,

b) C_{1-4} alkyl, optionally substituted with one to two halo, $-OR^5$ or phenyl,

or

c) $-C(=O)OR^5$;

R^9 is

a) $-OH$, or

5 b) $-OC_{1-4}$ alkyl;

R^{10} is C_{1-8} alkyl substituted with one or two of the following

a) $-C(=O)N(C_{1-4} \text{ alkyl})(CH_2)_nS(=O)_2O^+M^+$,

b) halo, or

c) $-NR^7R^8$;

10 R^{11} is C_{1-4} alkyl substituted with $-OR^5$, $-NR^7R^8$ or $-OC(=O)R^{10}$;

R^{12} is C_{1-4} alkyl substituted with $-OR^5$;

R^{13} is C_{1-4} alkyl substituted with $-OR^5$;

het is morpholinyl or thiophenyl;

M is sodium, potassium or lithium atom; and

15 n is 1 or 2.

5. A compound of claim 1 wherein

R^1 and R^3 are independently H,

R^4 is

20 a) H,

b) fluoro, or

c) $-OR^5$;

R^2 is

a) thiophenyl,

25 b) C_{1-6} alkyl substituted with $-OR^5$, $-OP(=O)(OH)_2$, $-OPH(=O)(OH)$ or $-OC(=O)R^{10}$,

c) $-C\equiv CR^{11}$, or

d) $-CH=CH-R^{12}$;

R^5 is

30 a) H, or

b) C_{1-4} alkyl, optionally substituted with $-OH$ or C_{1-4} alkoxy;

R^{10} is C_{1-8} alkyl substituted with one or two of the followings

a) $-C(=O)N(C_{1-4} \text{ alkyl})(CH_2)_2S(=O)_2O^+M^+$, or

b) $-NH_2$;

35 R^{11} is C_{1-4} alkyl substituted with $-OR^5$ or $-OC(=O)R^{10}$;

R^{12} is C_{1-4} alkyl substituted with $-OR^5$; and

M is sodium atom.

- h) R^2 and R^3 taken together are het or C_{4-6} cycloalkyl;

R^5 is

- a) H,
- b) C_{1-8} alkyl, optionally substituted with one to three $-OH$, CN , C_{1-4}
- 25 alkoxy, halo, $-NO_2$, het or aryl,
- c) aryl, or
- d) het;

R^7 and R^8 are independently

- a) H,
- 30 b) C_{1-8} alkyl, optionally substituted with one to three $-NO_2$, halo, $-CN$, OR^5 , aryl or het,
- c) aryl,
- d) het,
- e) $-(CH_2)_m-C(=O)OR^5$,
- 35 f) $-(CH_2)_m-C(=O)R^5$, or
- g) R^7 and R^8 taken together to form het;

R⁹ is

- a) -OH, or
- b) -OC₁₋₈ alkyl;

R¹⁰ is

- 5 a) H,
- b) C₁₋₈ alkyl,
- c) -NR⁷R⁸,
- c) C₁₋₈ alkyl substituted with one to two halo, het, -NR⁷R⁸ or -C(=O)N(C₁₋₄ alkyl)(CH₂)_nS(=O)₂O⁻M⁺;

10 R¹¹ is

- a) C₁₋₈ alkyl,
- b) C₁₋₈ alkyl substituted with one to three -CN, halo, -NO₂, -COOR⁵, -C(=O)R⁵, -SR⁵, aryl, -OR⁵, -NR⁷R⁸, -OP(=O)(R⁹)₂, -OPH(=O)R⁹ or -OC(=O)R¹⁰, or

- 15 c) -(CH₂)_m-het;

R¹² is

- a) H,
- b) -CN,
- c) C₁₋₈ alkyl,
- 20 d) C₁₋₈ alkyl substituted with one to three -CN, halo, -NO₂, -C(=O)R⁵, -COOR⁵, aryl, het, -SR⁵, -OR⁵, -NR⁷R⁸, -OP(=O)(R⁹)₂ or -OPH(=O)R⁹,
- e) -C(=O)R⁵, or
- f) -COOR⁵;

R¹³ is

- 25 a) C₁₋₈ alkyl,
- b) -(CH₂)_m-alkyl substituted one to three -CN, halo, -NO₂, -C(=O)R⁵, het, aryl, -COOR⁵, -SR⁵, -OR⁵ or -NR⁷R⁸,
- c) het,
- d) aryl,
- 30 e) -NR⁷R⁸, or
- f) OR⁵;

R¹⁵ is

- a) -NH₂, or
- b) -NHNH₂;

35 aryl is phenyl or naphthyl, optionally substituted with R¹⁶;

het is a 5-, 6- or 7-membered saturated or unsaturated heterocyclic ring having 1-3

heteroatoms selected from the group consisting of nitrogen, oxygen and sulfur, wherein the heterocyclic ring is optionally fused to a benzene ring, and optionally substituted with R¹⁸;

R¹⁸ is

- 5 a) halo,
- b) -NO₂,
- b) phenyl, optionally substituted with one to five -OH, -CN, halo, -NO₂,
C₁₋₆ alkyl, or OC₁₋₄ alkyl,

10 aryl, -SR⁵, -OR⁵ or -NR⁷R⁸, or
- d) OR⁵;

M is sodium, potassium or lithium atom;

i is 1 or 2;

m is 0, 1, 2, or 4;

- 15 n is 1, 2, 3 or 4;

and with the following provisos:

- (a) where R¹ is hydrogen, R² and R⁴ are each fluoro, R³ is het, then het is other than substituted piperazinyl,
- (b) where R¹, R² and R³ are each hydrogen, then R⁴ is not morpholinyl,
- 20 (c) where R¹, R², R³ and R⁴ are independently -NR⁷R⁸, then R⁷ and R⁸ are not hydrogen or alkyl,
- (d) het is other than cyclic amino.

7. A method of treating infections from herpesviruses which comprises
- 25 administering to a patient in need thereof an effective amount of a compound of formula I .

8. The method of claim 7 wherein said herpesviruses is herpes simplex virus types 1, herpes simplex virus types 2, varicella zoster virus, cytomegalovirus,
- 30 Epstein-Barr virus, human herpes viruses 6, human herpes viruses 7 or human herpes viruses.

9. The method of claim 7 wherein said herpesviruses is human cytomegalovirus.
- 35 10. The method of claim 7 wherein the effective amount of a compound of claim 1 is administered orally, parenterally or topically.

11. The method of claim 7 wherein the effective amount of a compound of claim 1 is in an amount of from about 0.1 to about 300 mg/kg of body weight.
12. The method of claim 7 wherein the effective amount of a compound of claim 1 is in an amount of from about 1 to about 30 mg/kg of body weight.
13. A pharmaceutical composition which comprises an effective amount of a compound of claim 1 and a pharmaceutically acceptable carrier.
14. A compound of claim 1 which is
- (1) *N*-[(4-chlorophenyl)methyl]-4-hydroxy-7-(trifluoromethyl)-3-quinoline-carboxamide;
 - (2) 7-amino-*N*-[(4-chlorophenyl)methyl]-4-hydroxy-3-quinolinecarboxamide;
 - (3) *N*-[(4-chlorophenyl)methyl]-8-fluoro-4,6-dihydroxy-3-quinoline-carboxamide;

Patent family members are listed in annex.

* Special categories of cited documents :

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier document but published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

INTERNATIONAL SEARCH REPORT

International application No.

PCT/US 98/25192

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 7-12
because they relate to subject matter not required to be searched by this Authority, namely:
Remark: Although claims 7-12
are directed to a method of treatment of the human/animal
body, the search has been carried out and based on the alleged
effects of the compound/composition.
2. ☐ Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such
an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all
searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment
of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report
covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is
restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

☐ The additional search fees were accompanied by the applicant's protest.

☐ No protest accompanied the payment of additional search fees.
